

Project Blueprint: Jacson3 Investment Portfolio Management

This document consolidates the findings, tactical strategies, and aspirations recorded across your notebook into a unified, actionable project plan.

Our overarching goal is to optimize the **Jacson3 Investment Portfolio** to fund a healthy, active retirement, target a **25% Target Total Annual Return (TTAR)**, and establish technical and physical automation that unchains you from your Lenovo Yoga 7i screen.

Investor Profile Summary

- **Investment Style:** Medium-term trend investor with a technical-momentum bias.
- **Risk Management:** Highly disciplined. Trailing stops are ratcheted up to protect profits during expansions; assets that breach support floors are systematically liquidated to preserve cash.
- **Data accuracy and timeliness:** Input accuracy and timeliness is paramount. All quoted asset pricing must be less than an hour old unless specifically stated (ie a daily close price) and timestamped so that it is auditable. All investment recommendations must be based on 'up to the hour' pricing info at the time the recommendation is made unless stated.
- **Hardware Setup:** Lenovo Yoga 7i laptop running a three-screen array (LG 23" monitor, Samsung 32" TV) to coordinate live charts, media, and dashboards.
- **Core Goal:** Move from manual chart-watching to an alert-driven, automated workflow that triggers physical notifications to your mobile device during critical market events, allowing you to cycle, hike, and enjoy retirement.

Proposed Strategic Objectives (Max 5)

Please review, edit, or confirm these five core outcomes to establish our project foundation:

Objective 1: Implement the WSAPT Dual-Level Risk & Accumulation Framework

- **Outcome:** Create a standardized, volatility-adjusted risk management engine across the entire Jacson3 watchlist using audited, pricing data no older than 1hr (always state pricing data age when making actionable recommendations as a final check of data accuracy)
- **Key Specifications:**
 - Define a dynamic, dual-level stop-loss strategy (Tight/Capital Preservation vs. Wide/Trend Defender).
 - Integrate Average True Range (ATR) padding rather than arbitrary fixed percentages to absorb standard market noise.
 - Define dual-level accumulation zones (Zone 1 for early pullback entries, Zone 2 for

- high-conviction institutional support testing).
 - Classify assets dynamically into **Active Trailing Stop Holdings** (such as high-beta tech/AI and crypto) vs. **Core Accumulation Holdings** (such as IAA.AX, which has no trailing stops).
- *Notebook Intent:* Developed in *Stop-Loss Master Table Development*, *Jacson3 Portfolio Stop-Loss Update*, and *Amazon Stock Stop Loss Strategies*.

Objective 2: Build the Jacson3 Dual-Asset Visual Dashboard

- **Outcome:** Develop an interactive, visually streamlined dashboard that aggregates your watchlist, tracks momentum, and isolates different market behaviors. Input accuracy and timeliness is paramount. All quoted asset pricing must be less than an hour old unless specifically stated (ie a daily close price) and timestamped so that it is auditable and all investment recommendations must be based on 'up to the hour' pricing info at the time the recommendation is made unless stated.
-
- **Key Specifications:**
 - **Tabbed Interface:** Separate high-velocity **Crypto** assets (BTC, SOL, ETH, Jup, USDC, SUI, PYTH, RAY, GRT, SKR, NOS) from high-conviction global **Shares** (Semiconductors, Big Tech, and Regional Utilities).
 - **Technical Indicators:** Native toggles for the 50-day and 200-day Simple Moving Averages (SMAs) to visualize "Golden Cross" setups and distance-from-...'average metrics. We will also take maximum advantage of the proprietary 'Larsson Line' indicator which is available in the hummdinger4 tradingview subscription, bollinger bands, fibonacci levels and rsi to help with market predictions when it makes sense to do so. Tradingview should be open in the samsung 32in.
 - **Volume Profile Integration:** Incorporate structural analysis like Point of Control (POC) and Low Volume Nodes (LVNs) to identify slippage risks and true technical floors (as seen in your ALAB analysis).
 - **Fundamental indicators:** Aggregated analyst commentary (expert AI interpretation) of long, medium and short-term fundamentals with potential to influence price trends for individual assets.
 - **Macro indicators:** Aggregated analyst Commentary (expert AI interpretation) of long and medium term macro with potential to influence price trends for individual assets and sectors.
 - **Data Pipeline:** Support dual-update methods: a native Google Sheets connection for portfolio tracking and a TradingView CSV importer for daily close prices via your hummdinger4@gmail.com account.
- *Notebook Intent:* Developed in *Building a Financial Dashboard*, *Investment Dashboard Development Discussion*, and *this is a daily chart for ALAB....*

Objective 3: Establish the TradingView Alert & Mobile Notification Bridge

- **Outcome:** Automate the "last mile" of execution on your TradingView Plus account, removing the need to manually draw lines or constantly watch live price action.
- **Key Specifications:**
 - Write a custom **Pine Script Bridge** that reads stop-loss matrix coordinates and automatically renders dynamic levels on your TradingView charts.
 - Configure TradingView Webhooks to push critical execution signals (Stop-Loss Breach, Accumulation Buy Trigger, Trend Break) directly to your mobile device via SMS or the TradingView app.
 - Ensure physical handshakes across your triple-monitor setup are fully optimized to support quick, stress-free manual analysis when an alert is triggered.
- *Notebook Intent:* Developed in *Automation Progress and Next Steps* and *LG monitor USB C thunderbolt*.

Objective 4: Deploy a Customized Macro & Environmental Intelligence Engine

- **Outcome:** Implement a structured daily and weekly reporting format designed specifically around your core investment theses (we need to allow for these theses to change or be updated so should create an updatable source reference doc for this that either Rusty can update or AI can make suggestions for) and regional constraints (Australia and New Zealand).
- **Key Specifications:**
 - **Cyclical & Environmental Themes:** Active monitoring of specific seasonal catalysts, such as the El Niño weather pattern impact on APAC utilities (Contact Energy and Meridian).
 - In- Passing overview of commodity (oil, gold, copper, minerals essential to data centre build out) trends where these influence other investment decisions.
 - **Regional Macro Dynamics:** Localized tracking of the New Zealand economy (RBNZ policy, wholesale swap rates, currency effects on USD-denominated assets, and local economic conditions). Currency crosses with AUD and USD are important to track as we look for foreign investment deployment opportunities.
 - **AI & Frontier Infrastructure:** Focused tracking of the AI data center buildout (e.g., NEXTDC, Marvell, Nvidia) and major liquidity events (e.g., the SpaceX SPCX IPO vacuum and its impact on peer assets like Rocket Lab).
 - **Link to Individual asset analysis:** Running commentary of macro and market fundamentals with potential to influence price trends must feed in to individual asset analysis and entry and exit recommendations for that asset.
 - **Currency market overview** (USD, AUD, NZD with an option to edit the list) with commentary on market timing of exchanging currencies must feed in to the individual asset entry and exit analysis and recommendations
- *Notebook Intent:* Developed in *Macro, AI, Space, Science, Watchlist Update, Solana Investment Thesis and Price Outlook, NEXTDC, and El Niño Stock Beneficiaries*.

Objective 5: Create a Returns, Dividend Cash Flow, & Drawdown

Calculator

- **Outcome:** Accurately measure actual investment performance and model recurring income flows to support active lifestyle drawdowns.
- **Key Specifications:**
 - **Staggered Cash Flow Analysis (XIRR):** Maintain an automated Internal Rate of Return (IRR) calculator that adjusts your CAGR based on staggered deposits (solving the limitations of simple cumulative return metrics).
 - **Fixed-Income & Dividend Tracking:** Manage specialized assets like STRC (Strategy Shares Short Duration High Yield Credit) on Moomoo, tracking ex-dividend schedules, semi-monthly payment cycles, and DRIP (Dividend Reinvestment) statuses.
- *Notebook Intent:* Developed in *Calculating Annualized Investment Return*, *Checking Moomoo Dividend Receipts*, and *STRC Dividend Dates 2026*.

Action Plan to Agree Objectives

1. **Review:** Look over the proposed objectives above. Are we capturing the exact balance of tech growth, crypto momentum, regional safety, and lifestyle freedom that you want?
2. **Refine:** Let me know if any objective needs to be tightened, expanded, or if we should combine any of them.
3. **Approve:** Once we agree on these five core pillars, we will create step-by-step implementation plans for each, beginning with the structure of your dashboard or the code for your TradingView Pine Script bridge.
